LINKED LISTS ON GEEKSFORGEEKS

Overview of Linked Lists

Linear Linked Lists

- The ListNode Class
- Operations using nodes only (i.e. no Linked List class):
  - **Traversal :** Traversing singly linked list
  - **Insertion :** At the beginning, At the end and At a specific position
  - **Deletion :** From beginning, From end and From a specific position
  - **Searching :** Find whether a given key exists in the list
  - **Updating (Modification) :** Modify contents of linked list.
  - **Reversal :** Reverse the linked list and make the last node as new head.
- A Linear Linked List Class

Doubly Linked Lists

- Why Doubly Linked Lists?
  - When is Doubly Linked List more Efficient than Singly Linked List?
  - Advantages, Disadvantages, and uses of Doubly Linked List
- Implementing Doubly Linked Lists

Run Time of Linked List vs. Array Algorithms

- Big O for Linked List Algorithms
- When to use Array over Linked List and vice versa?

Circular Linked Lists

- Implementing a Circular Linked List
