

Algorithm to Convert Infix Notation to Postfix

- 1.** Scan the infix expression from left to right.
- 2.** If the scanned character is an OPERAND, OUTPUT it.
- 3.** Else if the scanned character is an OPERATOR:
 - a.** If the stack is empty OR the stack contains a '(' OR the precedence of the scanned operator is greater than the precedence of the operator in the stack, PUSH it.
 - b.** Else, POP (and output) all the operators from the stack which have precedence greater than or equal to that of the scanned operator, or until you encounter an open parenthesis. PUSH the scanned operator to the stack.
- 4.** If the scanned character is an '(', push it to the stack.
- 5.** If the scanned character is an ')', pop the stack and output it until a '(' is encountered. Discard both the parentheses.
- 6.** Pop and output from the stack until it is not empty.
